

Your Chauffeur, Not a Chauffeur.

Redesigning a bring-your-own-car chauffeur super-app — home, services, the book-a-chauffeur flow, and profile — around one idea: **Careem assigns you a stranger; we introduce you to YOUR chauffeur.**

4 multi-agent sprints

197 AI design agents

North star: repeat-driver rebooking
rate

Benchmarked against Careem · Urban Company · JustLife · Uber Reserve

Prepared with the UX Council — a multi-agent design-critique method. 8 July 2026.

THE METHOD

How this was produced — the UX Council

Every decision here survived an adversarial process, not a single opinion. The principle: **diverge wide, converge hard**. Specialist lenses critique each screen in parallel, blind to each other; every finding is then attacked by a skeptic, grounded in a real case study or competitor pattern, and scored by **ICE** (**Impact × Confidence × Ease**). Only survivors reach the design.

- **Sprint 1 — Teardown:** 4 lenses review the current app · 9 findings ranked.
 - **Sprint 2 — Deep dive:** 10 lenses incl. Careem & Urban Company analysts · best home screen + services.
 - **Sprint 3 — Booking flow:** 8 lenses design the choose-your-chauffeur flow + founder-pitch ammo.
 - **Sprint 4 — Completion:** 6 lenses design the Profile page, feature set & UX-change checklist.
-

THE PROBLEM

A great catalog, hidden behind a weak front door

- A rich catalog (Airport, School runs, Pet-to-vet, Intercity, Sober driver, subscriptions) was **buried in the Services tab**; Home showed two unpriced cards + a thin 3-option sheet that duplicated it.
 - **Prices hidden** — only 2 of ~15 services showed a fare anywhere.
 - **Faceless driver illustrations**, zero social proof — on a service where a stranger drives your own car.
 - Clipped headings (“Chauffeu”, “Personai Chauffeur”) and unlabeled icon controls on a brand selling luxury.
-

THE INSIGHT

Turn the weakness into the moat

“The relationship isn’t browsed pre-ride — it’s earned post-ride.”

Careem and Uber **assign** the nearest stranger. JustLife lets you **pick your professional** — photo, rating, reviews — and rebook the same person. Applied to cars, that becomes **‘Choose your chauffeur’**: a named, rated, rebookable driver who becomes *your regular* across school runs, airport and nights out. The faceless-driver weakness becomes the emotional core of the super-app — and the north-star metric, **repeat-driver rebooking rate**, doubles as the social proof on the card.

DELIVERABLE 1

The best Home screen — 6 fixes

#	Fix	Why
1	Car-first: active-car chip pinned up top	Bring-your-own-car model — the car is the anchor, not a destination
2	One priced 'Book a chauffeur' action	Replaces two blank illustration cards; Pay/min + Hourly as a toggle
3	'from AED' price on every tile	Only 2 of 15 were priced; hidden cost is the #1 abandonment driver (Baymard)
4	Kill the 3-option sheet → 'See all' rails	Surfaces the buried catalog; reconciles Home with the Services tab
5	Fix clipped text + label every control	Polish IS the product for a luxury brand; WCAG 4.1.2 for icon buttons
6	Provable savings % on subscriptions	Makes 'Save more on longer trips' demonstrable, not a bare claim

DELIVERABLE 2

The book-a-chauffeur flow

Spine: Home → Service → When & Where → **Match Fork** → (Choose Chauffeur) → Review & Pay → Live Handoff → Rate & Rebook.

The centerpiece decision — urgency gates the choice, not preference:

Booking mode	Driver choice	Rationale
Drive me NOW	Auto-match only — no list	Protects ETA & supply; no choice to regret. Driver humanized on assignment (photo, ID, trip count)
Scheduled / Subscription	'Choose your chauffeur' unlocked	Lead time removes the ETA penalty. Auto-match stays the preselected default; choice is the +AED priced upgrade

Rebuttal ammo: Uber allows a Favorite Driver *only* inside Uber Reserve (scheduled, 2020) — never on-demand. Lyft reached the same conclusion independently. The assign-a-stranger giants already conceded that choice belongs in the scheduled tier.

The funnel the flow builds: **one-off** → **favorite** → **regular** → **subscription**. The 'Make Rashid your regular' CTA lands at the trip's end — the exact moment he's proven himself (Peak-End Rule).

DELIVERABLE 3

UX laws behind the decisions

UX law	The decision it justifies
Hick's Law	The fork is one binary choice, not a 30-driver browse; ASAP shows no list
Default Effect	Auto-match preselected; the default itself flips to 'your regular' for returning users
Paradox of Choice	Never a raw marketplace — regulars shelf + filter chips, one card per row
Social Proof	Rebook counts beat inflated stars: 'rebooked by 18 families · 34 school runs'
Halo Effect	Real face-forward photos; 'Ahmed will drive your car' resolves key-handover anxiety
Peak-End Rule	The 'make him your regular' CTA lands at trip end — peak trust
Goal-Gradient	'2 of 3 trips to Trusted status' pulls the next booking forward
Von Restorff	'Your regular' is a visually isolated gold card, pinned first
Jakob's Law	Heart-to-favorite + rebook mirror JustLife/Urban Company patterns users know
Information Scent	AED price appears 3 times, surprises 0 times — tile, fork, confirm
Fitts's Law	Full-width confirm CTA in the thumb zone, mirrored for Arabic RTL
Tesler's Law	Booking complexity absorbed by the system — saved car, Home/School chips, 'your usual'

DELIVERABLE 4

New services to complete the super-app

Priority	Service	What it is
Now	Sober Driver	Reposition 'After-party' — you + your car home safely + weekend pass
Now	Airport Round-Trip Valet	Drop at Departures in your car, drive it home, return it when you land
Now	School Run Plan	Named, vetted driver for fixed school slots — recurring revenue
Now	Car Care + Sparkle Plan	On-demand detailing + a recurring wash subscription

Priority	Service	What it is
Now	My Chauffeurs / Regulars ladder	The north-star engine as a Profile object — pin a driver per use-case
Now	One AED Wallet + Rafeeq Plus	Single wallet; ~AED 39/mo membership waives the choose-a-driver fee
Next	Paperwork Autopilot	Tracks Mulkiya, insurance, RTA — expiry auto-generates the errand booking
Next	Family / Household account	Members, cars, one shared wallet & regulars roster
Next	Legible per-trip insurance	'No-claims bonus protected' — the defensible trust moat
Next	Registration Renewal — DFY	One tap clears fines, pays Salik, runs inspection, delivers Mulkiya
Later	Corporate / Fleet profile	Cost centers, VAT-compliant invoicing
Later	Live Resale Value + EV Transition	The documented-car data becomes a sell concierge / EV planner

DELIVERABLE 5

Cross-app UX changes for a coherent, premium feel

Effort	Change
S	One design system — single icon set, one card, one type scale across all tabs
S	Standard price token everywhere — AED, savings-% chip, next-renewal date
S	One persistent bottom nav + coherent back & step-progress pattern
M	Price on every tile (kill 'no price' cards) — information scent
M	WCAG 2.2 AA pass — accessible names on icon buttons, 44px targets, contrast
M	'Your regulars' as one shared object — Home shelf = Choose card = Profile row
M	One unified verification badge (driver credential + per-car eligibility)
M	Profile reordered assets-first — Membership+Wallet → Garage → Regulars → settings sink
L	One RTL contract (logical CSS props); numerals stay LTR
L	One AED wallet spine funding chauffeur + errands + subscriptions

THE PITCH

Five lines that win the room

- “I never make the user choose between speed and choice — the booking **mode** chooses for them. Careem optimizes the next 10 minutes; we optimize the next 10 months.”
- “One decision per screen; the driver card carries exactly what the key-handover decision needs — depth on demand, never up front.”
- “Stars tell you he can drive; **rebook counts tell you people trust him twice.**”
- “The fare appears three times and surprises zero times; choosing a driver prices the **delta** explicitly.”
- “Recurring plans **never silently substitute** — for someone’s car and kids, an unannounced stranger isn’t friction, it’s churn.”

North-star metric: repeat-driver rebooking rate · Guardrails: booking completion & time-to-assignment must not regress.
